

## What is SD-WAN?

The increase of mobile workforces and transition to cloud services is driving the need for more secure and efficient WAN (Wide Area Network) technologies. SD-WAN (Software Defined-WAN) delivers networking capabilities that maximise WAN efficiency without compromising security. SD-WAN includes routing, firewall and SD-WAN management capability with access to functions via a cloud-based portal. This provides you with control and visibility of your network and application traffic.

## Benefits of SD-WAN?

- 
-  **Enhanced Security:** The latest firewall technology provides optimal protection against breaches and malicious activity.
  -  **Simplify Management:** Proactive management by Wireless Communications, assigning prioritisation for critical applications and traffic. This will also reduce complexity of dealing with multiple vendors.
  -  **Increase Efficiency:** Fast connections for users via multiple links and easily add new sites.
  -  **Improve Visibility:** Centralised configuration and monthly reporting improves your visibility of network and application performance.

## Our Simple SD-WAN Solution

Wireless Communications provides a simple 3 step solution to providing your business with SD-WAN:

-  **Select your Business IP link**
-  **Select your internet connection**
-  **Would you like mobile back-up?**

Once you have answered these 3 questions, Wireless Communications can commence designing your SD-WAN solution.
